What is essential? – A pilot survey on views about the requirements metamodel of reqT.org

Björn Regnell

Dept. of Computer Science, Lund University, Sweden bjorn.regnell@cs.lth.se

Abstract. [Context & motivation] This research preview presents ongoing work on the metamodel of a free software requirements modeling tool called reqT that is developed in an educational context. The work aims to make an initial validation of a survey instrument that elicits views on the metamodel of the reqT tool, which seek to engage computer science students in Requirements Engineering (RE) through an open source requirements engineering DSL embedded in the Scala programming language. [Question] The research question is: Which RE concepts are essential to include in the metamodel for a requirements engineering tool in an educational context? [Principal ideas] A survey instrument is developed with a list of 92 concepts (49 entities, 15 relations and 28 attributes) and a set of questions for each concept that elicit the respondents' views on the usage and interpretation of each concept. [Contribution] The survey is initially validated in a pilot study involving 14 Swedish RE scholars as subjects. The survey results indicate that the survey is feasible. The analysis of the responses suggest that many of the concepts in the metamodel are used frequently by the respondents and there is a large degree of agreement among the respondents about the meaning of the concepts. The results are encouraging for future work on empirical validation of the relevance of the reqT metamodel.

Keywords: requirements engineering, metamodel, CASE tool, engineering education, embedded domain-specific language, empirical software engineering.

1 Introduction

There are many challenges in teaching Requirements Engineering (RE) [4,6], including conveying requirements modelling skills that can be used effectively in an unstructured, non-ideal, real-world situation [1]. When teaching RE modelling we may ask ourselves: What are the *essential* RE concepts that we should include in our taught metamodel for requirements? This paper investigates this questions in conjunction with the on-going work of developing a metamodel for reqT [9], an open source requirements engineering tool [7] used in RE education [8]. A survey instrument is presented aiming to elicit the frequency of RE term usage and the degree of interpretation agreement. The responses from 14 Swedish RE scholars are analysed and discussed and conclusions suggest that a large subset of the concepts of the current reqT metamodel can be argued to be "essential" in that a majority of the subjects use them while agreeing with the concept definitions. The presented work is an initial validation and further work involving more subjects is needed to provide conclusions with more certainty.

2 Background

There are nowadays numerous commercial RE tools available, but many are expensive, complex and not sufficiently open [2]. A major aim of the reqT open source project is to provide a small but scalable, semi-formal and free software package for an educational setting [7] that can inspire code-loving computer science students to learn more about requirements modeling. The tool development started in 2011 at Lund University, where reqT is used in RE teaching at MSc level in the Computer Science & Engineering program [8].

A critical issue is how to choose the "essential" RE concepts that allows for sufficient expressiveness, while not overloading the metamodel with esoteric concepts just for the sake of completeness.

The reqT metamodel includes three types of concepts: entities, attributes and relations. Entities and attributes are nodes in a graph data structure, while relations are edges that can connect entities with sub-graphs. Thus a tree-like structure can be created of arbitrary depth spanning the graph that models some chunk of requirements.

The code below shows a toy example of an orthogonal variability model [5] expressed in the reqT Scala-embedded DSL [7] illustrating a small part of its metamodel. Other parts of the metamodel contains concepts that enable e.g. goal modelling and use case and user story modelling, see further Appendix A.

```
Model (
  Component("apperance") has (
   VariationPoint("color") has (
      Min(0), Max(2),
      Variant("blue"), Variant("red"), Variant("green")),
    VariationPoint("shape") has (
      Min(1), Max(1), Variant("round"), Variant("square")),
    VariationPoint("payment") has (
     Min(1), Max(2), Variant("cash"), Variant("credit")),
    VariationPoint("payment") requires Variant("cash"),
   Variant("round") excludes Variant("red"),
   Variant("green") requires Variant("square")),
 Component("apperance") requires VariationPoint("shape"),
 App("free") requires Component("apperance"),
 App("free") binds (
    VariationPoint("shape") binds Variant("round")),
 App("premium") requires Component("apperance"),
 App("premium") binds (
   VariationPoint("color") binds (Variant("red"), Variant("green")),
    VariationPoint("shape") binds (Variant("round"), Variant("square")),
    VariationPoint("payment") binds Variant("cash")))
```

Entities are in bold, attributes in italics and relations start with a lower case letter. In the reqT editor, entities, attributes, and relations are syntax-coloured in blue, green and red respectively. A reqT model written in the above syntax is actually valid Scala code that, when executed, generates data structure that can be traversed and manipulated using Scala scripts. Also visualisations can be generated using GraphViz export and export to HTML and spreadsheet formats.

3 Methodology and Data Collection

In order to validate RE scholar's opinions of the metamodel a survey instrument is developed including 49 entities, 15 relations and 28 attributes of the reqT Version 3.0 metamodel. All the concepts are listed with their definitions in Appendix A.¹ These concepts and definitions were gathered from various sources including the IREB Glossary ², wikipedia, terminology from agile development, variability [5] and goal modelling terminology, and the Lauesen text book [3] used in the RE course at Lund University [8], in which reqT is applied in student role-playing projects.

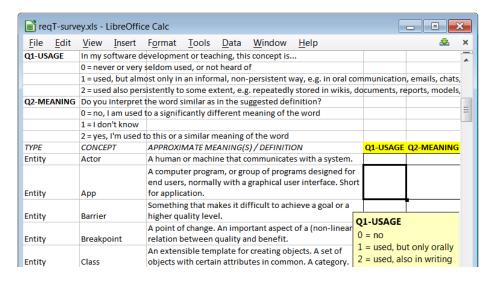

Fig. 1. A screen dump of a part of the survey instrument.

The data collection for the presented pilot run was made during a Swedish national network meeting with academic RE scholars in the spring of 2015. The survey was filled in during the meeting using the participants' own laptops in a downloadable spreadsheet as shown in Figure 1. The subjects were given 20 minutes to complete the survey. Most of the subjects handed in the survey via email directly after the session, while a few finshed it offline and emailed their response after the meeting.

4 Data Analysis

Subject background. The background questions in the survey regards the role of the subject, as shown in Table 1. In summary, the included³ total number of subjects is 14, of which 10 are teachers, 10 are developers and 13 are researchers.

¹ The survey is available at https://github.com/reqT/reqT/tree/3.0.x/survey

² https://www.ireb.org/en/cpre/cpre-glossary/

³ One subject answered NO on all background questions and was therefore excluded.

Table 1. Background of subjects, N = 15. The table use the subjects' anonymous ids S01–S15.

Background question

Do you teach software engineering and/or requirements engineering? YES/NO

Do you develop software by writing code and/or creating system models? YES/NO

Do you do academic research in software and/or requirements engineering? YES/NO

Subject responding YES

S01 S03 S04 S05 S07 S08 S09 S11 S12 S14

S01 S02 S03 S07 S08 S09 S10 S11 S13 S14

S01 S03 S04 S05 S06 S07 S08 S09 S10 S11 S12 S13 S14

Frequency analysis. The idea of "essentiality" is characterized as the number of subjects that has responded that they (1) use the concepts at least in an informal or nonpersistent way, and that they (2) use the concepts in a similar meaning as in the definition in Appendix A. Figure 1 shows the definitions of the three-level ordinal scales of Questions $Q1_{usage}$ and $Q2_{meaning}$ respectively. Table 2 shows the results of the frequency counts. If an "essentiality threshold" is chosen at N/2 then only the 9 concepts from row n=7 and below in Table 2 are considered "non-essential", hence showing that more than 90% of the metamodel concepts have a majority of the subjects that use and agree upon them. All concepts have at least one subject that use it and agree with the definition.

Table 2. Frequency analysis, where n is the number of subjects that for the respective concepts answered $(Q1_{usage} >= 1)$ and $(Q2_{meaning} = 2)$. In total there are 92 concepts (49 entities, 15 relations and 28 attributes). The higher up in the table, the more "essential".

n	Entities	Attributes	Relations
14	Class, Component, UseCase, Variant	Comment, Example, Max, Min, Title	implements, verifies
13	Configuration, Data, Design, Event, Quality, Scenario, Stakeholder, System, Term	Code, Constraints, Cost, FileName, Probability, Profit, Spec, Why	excludes, interactsWith, is, relatesTo, requires

5 Discussion and Conclusion

It can be questioned if "essentiallity" of a set of RE concepts can be characterized by how many RE scholars that use them. However, if someone use a certain concept and wants to model it, then the metamodel of the applied modelling approach needs to have it, in order for that person not to find that the metamodel is lacking vital parts. The presented survey is a pilot investigation with two main contributions: (1) the survey instrument and the data collection and analysis approach is feasible, and (2) for more than 90% of the metamodel concept there is a majority of the 14 participating RE scholars that use them and agree upon their definition.

Limitations. Due to the limited number of subjects and the high degree of homogeneity among subjects with respect to background, it is difficult to analyse and draw conclusions about potential differences in opinions between e.g. teachers and developers. Some subjects needed more time and completed their survey offline during the coming days, which may give a variation in how careful the responses were considered.

Further work. When developing a metamodel it is interesting not just to ask if the concepts to include are essential, but also to pose the question if is the set of concepts is complete. If some essential concept is missing from some stakleholder's viewpoint, then the metamodel is not sufficient. With more subjects participating in the presented RE metamodel survey, the analysis of answers to further questions on alternative terms and missing concepts will be enabled and beneficial to the further development of a comprehensive and complete, but not overloaded, RE metamodel.

Acknowledgments. This work is partly funded by VINNOVA within the EASE project.

Appendix A: Definitions of Metamodel Concepts

		Attribute	Definition
Entity	Definition	Benefit	A characterisation of a good or helpful result or
Actor App	A human or machine that communicates with a system. A computer program, or group of programs designed	Capacity	effect (e.g. of a feature). The largest amount that can be held or contained
Арр	for end users, normally with a graphical user interface.	capacity	(e.g. by a resource).
D. and	Short for application.	Code	A collection of (textual) computer instructions in
Barrier	Something that makes it difficult to achieve a goal or a higher quality level.		some programming language, e.g. Scala. Short for source code.
Breakpoint	A point of change. An important aspect of a (non-	Comment	A note that explains or discusses some entity.
C1	linear) relation between quality and benefit.	Constraints	A collection of propositions that restrict the pos-
Class	An extensible template for creating objects. A set of objects with certain attributes in common. A category.	Cost	sible values of a set of variables. The expenditure of something, such as time or ef-
Component	A composable part of a system. A reusable, inter-		fort, necessary for the implementation of an en-
Configuration	changeable system unit or functionality.	Damage	tity.
Configuration Data	A specific combination of variants. Information stored in a system.	Damage	A characterisation of the negative consequences if some entity (e.g. a risk) occurs.
Design	A specific realization or high-level implementation de-	Deprecated	A description of why an entity should be avoided,
Domain	scription (of a system part). The application area of a product with its surrounding		often because it is superseded by another entity, as indicated by a 'deprecates' relation.
Domain	entities.	Example	A note that illustrates some entity by a typical in-
Epic	A large user story or a collection of stories.	_ `	stance.
Event	Something that can happen in the domain and/or in the system.	Expectation	The required output of a test in order to be counted as passed.
Feature	A releasable characteristic of a product. A (high-level,	FileName	The name of a storage of serialized, persistent
F at the	coherent) bundle of requirements.	F	data.
Function	A description of how input data is mapped to output data. A capability of a system to do something specific.	Frequency Gist	The rate of occurrence of some entity. A short and simple description of an entity, e.g. a
Goal	An intention of a stakeholder or desired system prop-	0131	function or a test.
Tdaa	erty.	Image	(The name of) a picture of an entity.
Idea Interface	A concept or thought (potentially interesting). A defined way to interact with a system.	Input Max	Data consumed by an entity, The maximum estimated or assigned (relative)
Issue	Something needed to be fixed.		value.
Item Label	An article in a collection, enumeration, or series. A descriptive name used to identify something.	Min	The minimum estimated or assigned (relative) value.
Member	An entity that is part of another entity, eg. a field in a in	0rder	The ordinal number of an entity (1st, 2nd,).
	a class.	Output	Data produced by an entity, e.g. a function or a
Meta	A prefix used on a concept to mean beyond or about its own concept, e.g. metadata is data about data.	Prio	test. The level of importance of an entity. Short for pri-
MockUp	A prototype with limited functionality used to demon-	F110	ority.
·	strate a design idea.	Probability	The likelihood that something (e.g. a risk) occurs.
Module Product	A collection of coherent functions and interfaces. Something offered to a market.	Profit	The gain or return of some entity, e.g. in monetary terms.
Quality	A distinguishing characteristic or degree of goodness.	Spec	A (detailed) definition of an entity. Short for spec-
Relationship	A specific way that entities are connected.	Chahua	ification
Release	A specific version of a system offered at a specific time to end users.	Status	A level of refinement of an entity (e.g. a feature) in the development process.
Req	Something needed or wanted. An abstract term denot-	Text	A sequence of words (in natural language).
	ing any type of information relevant to the (specifica-	Title	A general or descriptive heading.
	tion of) intentions behind system development. Short for requirement.	Value Why	An amount. An estimate of worth. A description of intention. Rationale.
Resource	A capability of, or support for development.	Ī.
